## (3) School of Science and Engineering Bachelor's Program in Interdisciplinary Engineering

Foundation Subjects for Major(Required)

|                  |  | (Nequired)            |             | standard                 |                          |                                  |               |               |   |   |
|------------------|--|-----------------------|-------------|--------------------------|--------------------------|----------------------------------|---------------|---------------|---|---|
| Course<br>Number | Course Name                                      | Instructional<br>Type | Credit<br>s | registra<br>tion<br>year | Term                     | Meeting<br>Days, Per<br>iod etc. | Classro<br>om | Instructor    | Course Overview   | Remarks   |
| FJ20004          | Linear Algebra I                                 | 4                     | 3. 0        | 1                        | FallABC                  | Wed4, 5                          | 3A213         | Tong Xiao-Min | vectors. The primary goal of this course is to understand the systems of linear equations, classifications of matrices and their applications. Although most of the problems can be solved without Mathematica, you are encouraged to solve the homework using the software once you know how to solve the problems. The course is a prerequisite for "Linear Algebra II"   | Lecture is conducted in English. Hybrid or Others Online (Synchronous), and the recorded materials are available to the students who cannot attend the class synchronously. |
| FJ20014          | Linear Algebra II                                | 4                     | 3. 0        | 1                        | SprABC                   | Wed4, 5                          | 3A214         | Sharmin Sonia | Following "Linear Algebra 1"", "Linear Algebra II" will also concentrate on the basics of linear algebra. Emphasis will be given to topics that will be useful in other disciplines, such as determinants, eigenvalues, positive definite matrices, Fourier series and the Fast Fourier Transform. Some homework problems may require you to use a program such as MATLAB or Mathematica, an important tool for numerical linear algebra. No previous programming experience is required.   | Lecture is conducted<br>in English.<br>Hybrid or Others<br>(i.e. Face-to-<br>Face+Online<br>(Asynchronous))   |
| FJ20104          | Calculus I                                       | 4                     | 4. 0        | 1                        | FallA<br>FallAB<br>FallC | Thu5, 6<br>Tue1, 2               | 3A311         | Sano Nobuyuki | This course along with the subsequent course "Calculus II" introduces the basic tools of calculus and develops their technical competence. The primary goal of this course is to understand the concept and to build up a working ability of various mathematical manipulations such as derivatives, integrals, differential equations, parametric representations, polar coordinates, etc. This is efficiently achieved by visualization, numerical and graphical experimentations and, thus, students are required to be acquainted with Mathematica (or similar ones) during the course as working exercises and homework problems. This course as well as "Calculus II" provides a core and practical knowledge required for many scientific courses you shall take hereafter in the IDE program. | Lecture is conducted<br>in English.<br>Hybrid or Others<br>face-to-face,<br>Synchronous and<br>Asynchronous, Take-<br>home exam   |
| FJ20114          | Calculus II                                      | 4                     | 4. 0        | 1                        | SprA<br>SprAB<br>SprC    | Tue5, 6<br>Thu4, 5               | 3A311         | Sano Nobuyuki | Following the "Calculus 1", this course also introduces the basic tools of calculus and develops their technical competence, namely, differential equation, infinite series, vector calculus, spherical coordinate system, and partial derivatives etc. This is achieved again by visualization, numerical and graphical experimentations and, thus, students are required to be acquainted with Mathematica (or similar ones) during the course as working exercises and homework problems. This course as well as "Calculus 1" provides a core and practical knowledge required for many scientific courses you shall take hereafter in the IDE program.  | Lecture is conducted<br>in English.<br>Hybrid or Others<br>face-to-face,<br>Synchronous and<br>Asynchronous, Take-<br>home exam   |
| FJ20124          | Introduction to<br>Single-Variable<br>Calculus I | 4                     | 2. 0        | 1                        | SprA<br>FallA            | Tue2<br>Thu5, 6<br>Tue1          |               | Sano Nobuyuki | This course along with the subsequent courses "Introduction to Single-Variable Calculus II" and "Advanced Calculus" introduces the basic tools of calculus and develops their technical competence. The primary goal of this course is to understand the concepts and to build up a working ability of various mathematical manipulations such as derivatives and integrals. This is efficiently achieved by visualization, numerical and graphical experimentations and, thus, students are required to be acquainted with Mathematica (or similar ones) during the course for working exercises and homework problems. The present course provides a basic core and practical knowledge required for many courses in both natural and social sciences.  | Lecture is conducted in English. Hybrid or Others face-to-face, Synchronous and Asynchronous, Take-home exam  |

|                  | Introduction to<br>Single-Variable<br>Calculus II | 4                     | 2. 0        | 1                                    | FallBC          | Tue1, 2                          |               | Sano Nobuyuki                        | This course along with "Introduction to Single- Variable Calculus I" and "Advanced Calculus" introduces the basic tools of calculus and develops their technical competence. The primary goal of this course is to understand the concepts and to build up a working ability of various mathematical manipulations such as parametric equations, polar coordinates, infinite sequences and series. This is efficiently achieved by visualization, numerical and graphical experimentations and students are required to be acquainted with Mathematica (or similar ones) during the course for working exercises and homework problems. The present course provides a basic core and practical knowledge required for many courses in both natural and social sciences. | Lecture is conducted<br>in English.<br>Hybrid or Others<br>face-to-face,<br>Synchronous and<br>Asynchronous, Take-<br>home exam  |
| FJ20144          | Advanced Calculus                                 | 4                     | 4. 0        | 1                                    | SprA<br>SprABC  | Tue5, 6<br>Thu4, 5               |               | Sano Nobuyuki                        | Following "Introduction to Single-Variable Calculus I & II." this course introduces the basic tools of calculus and develops their technical competence, namely, differential equations, infinite series, vector calculus, curvilinear coordinate systems, and partial derivatives, etc. This is achieved by visualization, numerical and graphical experimentations and, thus, students are required to be acquainted with Mathematica (or similar ones) during the course as working exercises and homework problems. This course as well as "Introduction to Single-Variable Calculus I & II" provides a core and practical knowledge required for many courses in both natural and social sciences.   | Lecture is conducted<br>in English.<br>Hybrid or Others<br>face-to-face,<br>Synchronous and<br>Asynchronous, Take-<br>home exam  |
|                  | Probability and<br>Statistics                     | 1                     | 2. 0        | 1                                    | FallAB<br>FallC | Thu2<br>Thu1, 2                  |               | Islam Monirul<br>Muhammad            | This course introduces basics of probability theory and statistics. This course will be mainly oriented to interpret physical problems in engineering and natural sciences through application of probability theory and statistics. Evaluation will be done through class quiz, homework on regular basis, and final examinations.   | Lecture is conducted<br>in English.<br>Hybrid or Others<br>face-to-face,<br>Online (Asynchronous)<br>and<br>Online (Synchronous)   |
| FJ22004          | Electromagnetism I                                | 4                     | 3. 0        | 2                                    | FallABC         | Wed2, 3                          | 3A408         | AFALLA JESSICA<br>PAULINE CASTILLO   | This course introduces the classical theory of electromagnetism at an undergraduate level. It begins with the fundamental laws and relations governing electrostatic force, electric field and electric potential. These quantities are calculated based on a given system of charges or a given charge distribution. The course also continues with work and energy in electrostatics, electric fields in matter (the concepts of polarization and linear dielectrics), as well as electric fields due to polarized objects.   | Lecture is conducted in English. Hybrid or Others face to face and some meetings online. recording the face-to-face classes, in case there are any students who are unable to be physically present. |
| FJ22014          | Electromagnetism II                               | 4                     | 3. 0        | 2                                    | SprABC          | Tue2, 3                          |               | You Borwen                           | compares with those properties of electrostatics. The electromagnetic induction is then revealed from the time-   | Lecture is conducted<br>in English.<br>Only for IDE<br>students<br>Hybrid or Others  |
| FJ25101          | Electrical Circuit                                | 1                     | 2. 0        | 2                                    | FallAB          | Tue5, 6                          | 3A305         | Osawa<br>Hirotaka, Akimoto<br>Yutaro | A lecture is given on basic knowledge and analysis methods of electrical and electronic circuits, including linear passive elements, sinusoidal alternating current and complex number, impedance and admittance, resonant circuits, mutual induction circuits, bridge circuits, filters, general circuit theorems, and AC power.   | Lecture is conducted<br>in English.<br>Henglish.<br>To or Others<br>face-to-face and<br>Online (Asynchronous)  |
| FJ26004          | Mechanics I                                       | 4                     | 2. 0        | 1                                    | FallAB          | Mon5, 6                          | 3A213         | Matsuda Akihiro                      | Primary goals of Mechanics I is to develop students' ability to (i) analyze problems in a simple and logical manner and (ii) apply basic principles to find their solutions. This course reviews such fundamental concepts as coordinate, time, mass, force and energy for a particle. The students are required to solve exercises and work on homework assignments.   | Lecture is conducted<br>in English.<br>Online (Asynchronous)   |
| FJ26014          | Mechanics II                                      | 4                     | 2. 0        | 1                                    | SprAB           | Mon5, 6                          | 3A213         | Kawai<br>Masamichi,Shoji<br>Gaku     | Following "Mechanics I", "Mechanics II " will just concentrate on the basics of mechanics. Emphasis will be given to topics that will be useful in other disciplines, such as systems of particles, kinematics and plane motion of rigid bodies and principles about analytical vector mechanics.   | Lecture is conducted<br>in English.<br>Hybrid or Others<br>face-to-face and<br>Online (Asynchronous)   |

|------------------|--------------------|-----------------------|-------------|--------------------------------------|---------|----------------------------------|-------------------------------------|--|---|--|
| FJ26104          | Thermodynamics I   | 4                     | 2.0         | 2                                    | FallAB  | Tue3, 4                          | 3A311                               | Kaneko Akiko   | Thermodynamics is one of the essential physics to discuss energy conservation for engineer in various fields. The aim of this lecture is to master the basics of the first and second laws of thermodynamics. The specific goal is to be able to appropriately express the first law of thermodynamics for the system, to be able to discuss changes in entropy based on the second law of thermodynamics, and to combine these basic matters. The heat efficiency of the heat engine can be derived.   | Lecture is conducted<br>in English.<br>Hybrid or Others<br>face-to-face and<br>Online (Asynchronous)   |
| FJ26114          | Thermodynamics II  | 4                     | 1.0         | 2                                    | SprAB   | Fri4                             |                                     | Kaneko<br>Akiko, Kanagawa<br>Tetsuya   | Thermodynamics is one of the essential physics to discuss energy conservation for engineers in various fields. Based on the first and second laws of thermodynamics learned in "Thermodynamics I", we learn free energy and chemical potential as new state quantities, and advanced matters of thermodynamics such as Maxwell relations and phase changes. The aim is to be able to understand these matters based on the major principles of the first law and the second law, and to cultivate the ability to reconstruct the learned matters from a new perspective by using them as tools. | Lecture is conducted<br>in English.<br>Hybrid or Others<br>(face-to-face and<br>Online (Asynchronous)<br>)   |
| FJ27004          | Programming I      | 4                     | 2. 0        | 1                                    | SprAB   | Fri1, 2                          | 3L201,<br>3L206,<br>3L207,<br>3L504 | Utsuro Takehito  | This course, introduction to programming, is focused on the first steps in C language. Topics that will be covered include fundamentals of programming languages applicable to general engineering systems. They include C-Language (fundamental operations, standard input-output functions), control statements (branching and jumps, if-statement, looping, while- and for-statements), fundamental data types, basics of making and using functions, storage classes and functions, arrays, character strings, and multidimensional array.  | Lecture is conducted<br>in English.<br>Only for IDE<br>students<br>Online (Asynchronous)   |
| FJ27014          | Programming II     | 4                     | 1.0         | 1                                    | SprC    | Fri1, 2                          | 3L504,<br>3L201                     | Kitahara Itaru   | [Objective] Develop the ability to process information well using computers. [Overview] Learn the basics of programming in C-language. [Topics] Memory space (scoping), Memory address (pointer variable), Function, File 1/0, Structure, Linked list, Sorting.   | Lecture is conducted<br>in English.<br>Only for IDE<br>students<br>Online (Asynchronous)   |
| FJ27024          | Programming III    | 4                     | 2. 0        | 2                                    | FallAB  | Fri1, 2                          | 3A305                               | Maruyama Tsutomu   | Introduction to algorithm, data structure and computational complexity: Writing C program: Programming techniques   | Lecture is conducted<br>in English.<br>Only for IDE<br>students<br>Hybrid or Others<br>face-to-face and<br>Online (Asynchronous)   |
| FJ27034          | Programming IV     | 4                     | 1.0         | 2                                    | FallC   | Fri1, 2                          | 3A305                               | Kameda Yoshinari   | After Programming I - III. Learn C programming skill by coding basic computer graphics programs.  | Lecture is conducted<br>in English.<br>Only for IDE<br>students<br>Hybrid or Others<br>face-to-face and<br>Online (Asynchronous)   |
| FJ28003          | Fundamental Labs I | 3                     | 2.0         | 2                                    | FallABC | Mon3-5                           | 3L103,<br>3L203,<br>3L204,<br>3L205 | Nakauchi<br>Yasushi, Matsuda<br>Akihiro, Yamaguch<br>i<br>Tomoyuki, Yasojim<br>a Akira | Fundamental labs for the basics of Engineering Systems. The labs consist of 6 themes. Each theme will be concluded in 2 weeks (2 weeks x 6 thems = 12 weeks). The 6 thems are as follows: 1. System control engineering basic students' labs, 2. Basics of linear systems using operational amplifiers, 3. Diodes and transistors, 4. Basics of logic circuits and computers, 5. DC motor manufacturing and control, and 6. Mechanisms and mechanical elements.   | Only for IDE students Labs (instructions) are conducted in English. We'll condut the labs by face-to-face if the COVID situation allows. If not, we'll conduct as online (asynchronous) with the video suppliments, virtual data, etc. |

|------------------|----------------------------|-----------------------|-------------|--------------------------------------|--------|----------------------------------|---------|---------------|---|--|
| FJ12101          | Statistical Physics I      | 1                     | 1.0         | 3                                    | FallAB | Wed5                             |         | Sano Nobuyuki | Statistical Physics as well as Quantum Mechanics provides the most important backbone of modern physics. In the present course, the basic principles of statistical mechanics are explained. After reviewing the basics of probability theory, the fundamental assumption of Statistical Mechanics, "principle of equal a priori probabilities," is introduced to construct statistical ensembles. The microscopic interpretation of entropy is explained so that the connection to thermodynamics becomes constructed. | Lecture is conducted<br>in English.<br>Hybrid or Others  |
| FJ12111          | Statistical Physics<br>II  | 1                     | 1.0         | 3                                    | FallC  | Wed4, 5                          |         | Sano Nobuyuki | The fundamental concepts introduced in Statistical Physics I are applied to a few simple physical systems such as ideal gases. We derive the classical (Boltzmann) and quantum (Fermi-Dirac and Bose-Einstein) statistics from statistical ensembles. The fundamental principles underlying when extracting the maximum work from heat are clarified. The physical interpretation and connection between chemical reaction and Gibbs free energy are also discussed.  | Lecture is conducted<br>in English.<br>Hybrid or Others  |
| FJ12121          | Statistical Physics<br>III | 1                     | 1.0         | 3                                    | SprAB  | Wed5                             |         | Sano Nobuyuki | Following "Statistical Physics I, II", the fundamental principles and various statistical ensembles in Statistical Mechanics are applied to some important phenomena and models encountered in physics, namely phase transition and landau phenomenological theory, binary mixture such as alloys, semiconductor statistics and quasi-Fermi potentials. A brief introduction to nonequilibrium statistical mechanics such as kinetic theory of gas, linear response, and Boltzmann transport theory, is also explained. | Not open in 2021.<br>Lecture is conducted<br>in English. |

|------------------|----------------------------------|-----------------------|-------------|--------------------------------------|------------------|----------------------------------|---------------|------------------|---|--|
| FJ12201          | Quantum Mechanics I              | 1                     | 1.0         | 3                                    | SprA             | Tue/Thu<br>2                     |               | Sharmin Sonia    | After a brief historical review, we will cover the basics of quantum theory from the perspective of wave mechanics. This includes a discussion of the wavefunction, the probability interpretation, operators, and the Schrödinger equation. We will then consider simple one-dimensional scattering and bound state problems. Next, we will cover the mathematical foundations needed to do quantum mechanics from a more modern perspective. We will review the necessary elements of matrix mechanics and linear algebra, such as finding eigenvalues and eigenvectors, computing the trace of a matrix, and finding out if a matrix is Hermitian or unitary. We will then cover Dirac notation and Hilbert spaces. The postulates of quantum mechanics will then be formalized and illustrated with examples. | Not Open in 2021.<br>Lecture is conducted<br>in English.<br>Hybrid or Others |
| FJ12211          | Quantum Mechanics II             | 1                     | 1.0         | 3                                    | SprBC            | Thu2                             |               | Sharmin Sonia    |   | Not Open in 2021.<br>Lecture is conducted<br>in English.                     |
| FJ12221          | Quantum Mechanics III            | 1                     | 1. 0        | 4                                    | FallAB           | Thu2                             |               | Sharmin Sonia    |   | Not Open in 2021.<br>Lecture is conducted<br>in English.                     |
